

# **FTP LOG ANALYSIS AND FILE INTEGRITY MONITORING PROJECT**

**PREPARED BY: PRANIT KALAMBATE**

**ROLE/PROGRAM: TRAINED IN CEH  
CURRICULUM / CYBERSECURITY ANALYST  
TRAINING**

**DATE COMPLETED: 10-12-2025**

# 1.PROJECT OVERVIEW

## 1.1 Goal

The primary goal of this project is to perform FTP (File Transfer Protocol) log analysis using Splunk Enterprise to:

- Extract critical FTP-specific fields like username and command.
- Analyze user activity (uploads, downloads, deletes).
- Monitor for security threats such as unauthorized transfers and failed login/transfer attempts.

## 1.2 Data Source

The project utilizes FTP server access logs ingested into Splunk.

Source: ftp.log.gz

Sourcetype: ftplog

## **2.FIELD EXTRACTION PROCESS (ADVANCED CONFIGURATION)**

Unlike UI-based extractions, for this project, I used an Inline Regular Expression within the Splunk configuration to define fields permanently. This method demonstrates a deeper understanding of Splunk architecture and log parsing logic.

### 2.1 Inline Field Extraction Details

- Configuration Name: ftp\_field\_extraction
- Applied to Sourcetype: ftplog
- Type: Inline

### 2.2 Extraction Regular Expression (Regex)

The following specific regular expression was used to parse the raw FTP log events, assigning meaningful names to the extracted data groups ((?<fieldname>...)):

```
^(?<epoch>\d+\.\d+)\s+(?<session_id>\S+)\s+(?<src_ip>\d+\.\d+\.\d+\.\d+)\s+(?<src_port>\d+)\s+(?<dest_ip>\d+\.\d+\.\d+\.\d+)\s+(?<dest_port>\d+)\s+(?<protocol>\S+)\s+(?<username>\S+)\s+(?<command>\S+)\s+(?<file>
```

```
e_path>\S+)\s+\S+\s+\S+\s+(?<response_code>\d+)\s+(
?<response_msg>.*)
```

## 3.ANALYSIS OF FTP ACTIVITY BASELINES

### 3.1 Total FTP Activity by Command

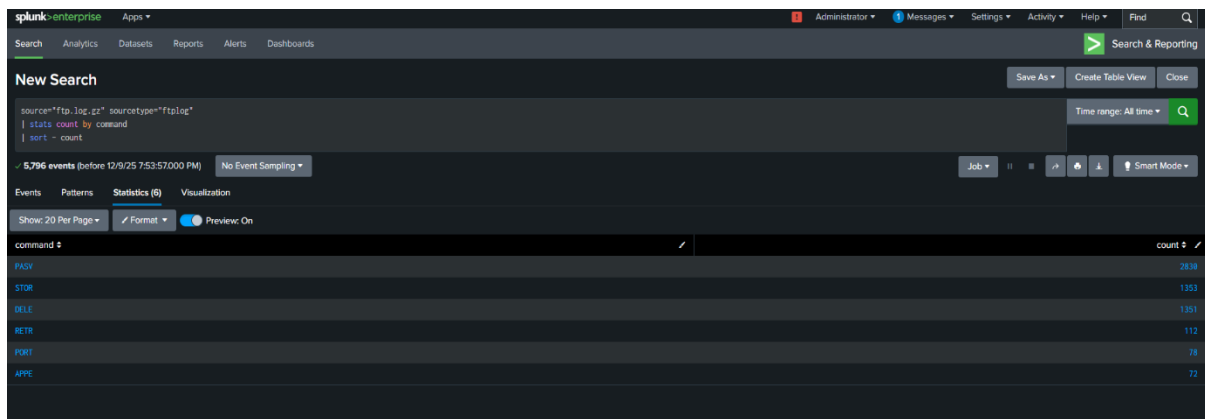

This analysis establishes the baseline of command usage, showing which FTP operations (uploads, downloads, deletions) are most frequent.

SPL Query:

```
source="ftp.log.gz" sourcetype="ftplog" | stats count  
by command | sort - count
```

Results (Partial): The results show a clear hierarchy of activity:

- PASV (Passive Mode) is the most frequent command (2838 counts), followed by STOR (Upload) (1353 counts).
- DELE (Delete) is also very common (1351 counts), indicating high file management activity.
- RETR (Download) is relatively low (112 counts), suggesting the server is used more for uploads/storage than downloads.

command	count
PASV	2638
STOR	1351
DELE	1351
RETR	112
PORT	78
APPC	72

## 3.2 Most Frequent FTP Users

This analysis shows which usernames are generating the most overall activity. I focused specifically on upload activity (STOR command), as uploads are crucial for file integrity monitoring and assessing file storage usage.

SPL Query (Uploads):

```
source="ftp.log.gz" sourcetype="ftplog"
command="STOR" | stats count AS total_uploads by
username | sort - total_uploads
```

Results (Partial): The user password@example.com accounts for the vast majority of upload activity (1351 uploads). Other users like justinwray@justinwray.com and <hidden> show minimal activity.

## 4. SECURITY ANALYSIS AND FILE INTEGRITY MONITORING

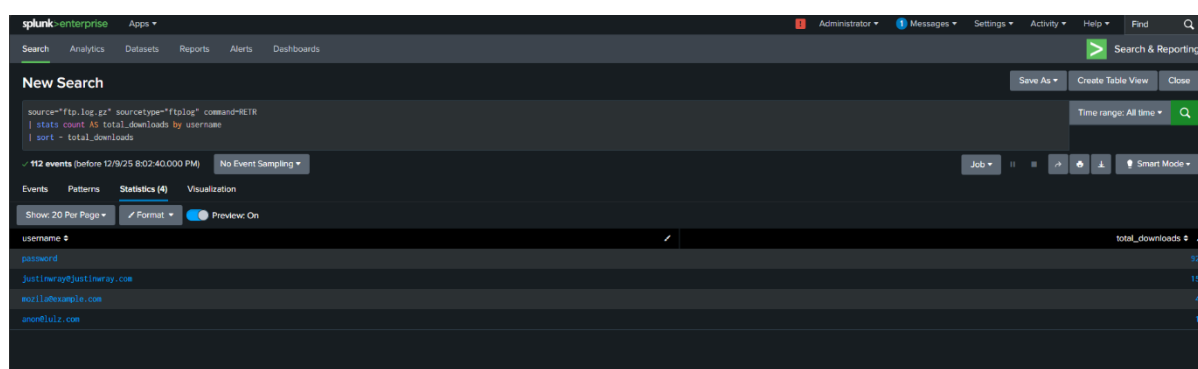

### 4.1 Top Downloads by User

Monitoring download activity is crucial to detect large-scale data retrieval, which could indicate data theft or unauthorized access.

SPL Query:

```
source="ftp.log.gz" sourcetype="ftplog"  
command="RETR" | stats count AS total_downloads  
by username | sort - total_downloads
```

Results (Partial): The user password (92 downloads) is the primary downloader, followed by justinwray@justinwray.com (15 downloads). Monitoring this list helps establish a baseline for who should be accessing data.

The screenshot shows the Splunk Enterprise interface with a search query executed. The query is: `source="ftp.log.gz" sourcetype="ftplog" command="RETR" | stats count AS total_downloads by username | sort - total_downloads`. The results are displayed in a table with two columns: `username` and `total_downloads`. The results are sorted by `total_downloads` in descending order.

username	total_downloads
password	92
justinwray@justinwray.com	15
example@example.com	4
anon@123.com	1

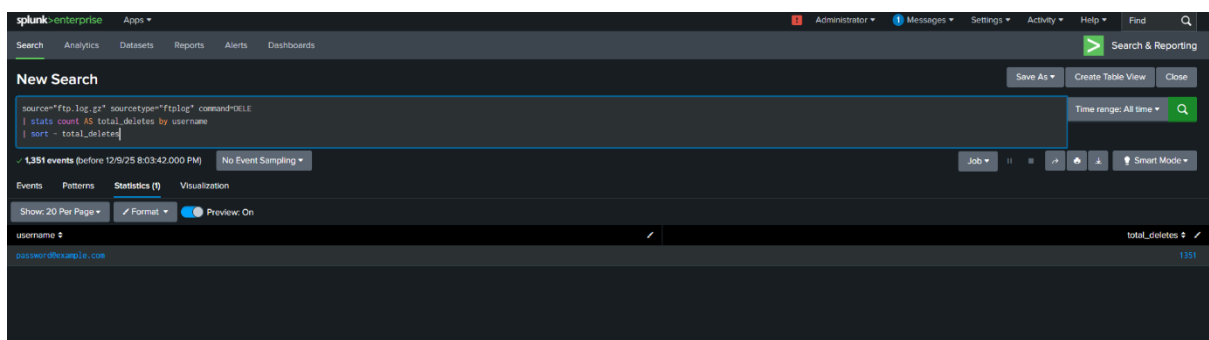

## 4.2 File Deletion Monitoring (High-Risk Activity)

File deletion is a high-risk activity that must be closely tracked to ensure file integrity.

SPL Query:

```
source="ftp.log.gz" sourcetype="ftplog"  
command="DELE" | stats count AS total_deletes by  
username | sort - total_deletes
```

Results (Partial): The user password@example.com performed all the detected deletion activities (1351 deletions), making them the sole focus of file integrity checks.

## 4.3 Monitoring for Failed Commands

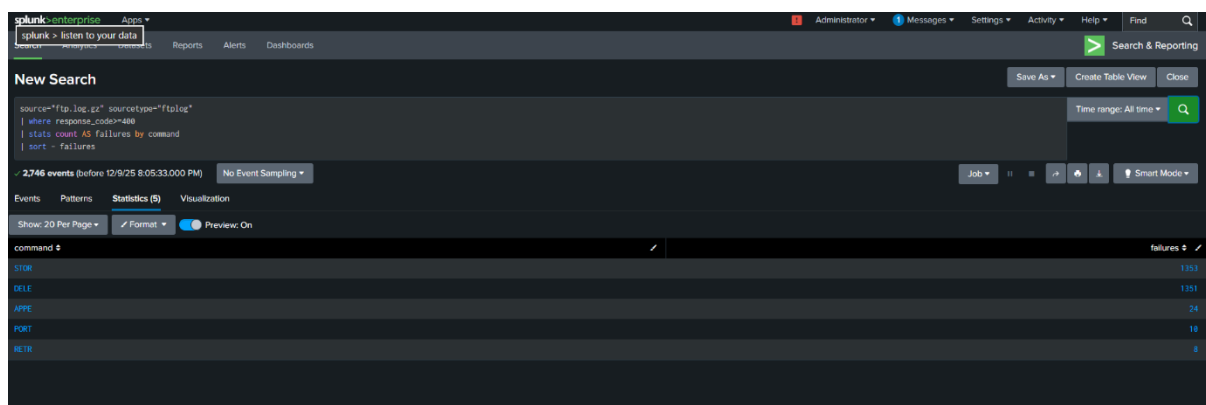

Failed commands (response code 4xx/5xx) often indicate unauthorized access attempts, failed transfers, or permission issues.

SPL Query (Failed Commands):

```
source="ftp.log.gz" sourcetype="ftplog" | where  
response_code=400 | stats count AS failures by  
command | sort - failures
```

The query filters for a 400-series response\_code, which typically signifies client-side errors or authentication/permission failures.

Results and Interpretation: The top failed commands are STOR (1353 failures) and DELE (1351 failures). This is a critical finding:

The screenshot shows the Splunk Search interface with the following query and results:

```
source="ftp.log.gz" sourcetype="ftplog"  
| where response_code=400  
| stats count AS failures by command  
| sort - failures
```

2746 events (before 12/9/25 8:05:33.000 PM) No Event Sampling

command	failures
STOR	1353
DELE	1351
APPC	24
PORT	16
BLTR	8

Massive Failure Rate: The total number of failed uploads (1353) and deletes (1351) exactly matches the total number of attempts by the primary user (password@example.com) from Section 3.2 and 4.2.

Conclusion: The primary user failed every single upload and delete attempt, likely due to incorrect permissions or a session error. This suggests a major file management problem or a persistent security policy enforcement issue.

#### 4.4 Top Error Generating Users:

Splunk SPL

```
source="ftp.log.gz" sourcetype="ftplog"  
response_code=400 | stats count AS error_count by  
username | sort - error_count
```

The user password@example.com accounts for 2702 error events, confirming they are the source of all these failures.

## 5.CONCLUSION

This project successfully analyzed FTP logs to establish operational baselines and uncover a critical security/integrity issue. By using the stats command to track activity by username and command, the project demonstrated effective File Integrity Monitoring. The analysis of failed commands revealed a pervasive issue where the primary user failed every upload and delete attempt, an incident requiring immediate administrative action to correct permissions and prevent data loss or service disruption. This work highlights my ability to use Splunk to manage file integrity and diagnose security incidents across critical network protocols.
